Cyber Threats Don't Sleep.
Neither Should Your Security Team.

It's no longer a matter of if, but when your credit union could be attacked; credit unions similar to yours are experiencing breaches. Our team is committed to helping you improve your security posture and comply with regulations through our managed security service, CU Assured.

CU Assured monitors your entire credit union's IT environment to detect intrusions, threats, and vulnerabilities on a dashboard providing detailed reporting, information, analysis tools, and alarms. Since CU Assured is built for credit unions of all sizes, it has two options for monitoring: Federated and Multitenant. With Federated, the CU Assured Server is at the credit union. With Multitenant, the CU Assured Server is located in a PCI compliant Operation Center, and alarms are sent from Sensors at the credit union. The CU Assured team will be there to monitor and help your IT Staff in both options.

Program Benefits

- Assist in complying with NCUA Regulation 748
- Reduced Operational Costs & improves IT staff efficiency
- CU Assured Cyber Security Team support
- Detects intrusions quickly

Unified Security Management (USM)

Centralized security monitoring provides powerful threat detection capabilities across your cloud and on-premise landscape with reporting capabilities that help comply with NCUA Regulation 748.

Integrated Threat Intelligence

Actionable threat intelligence updates from CU Assured are delivered continuously to the Unified Security Management platform. Powering the platform with up-to-the-minute threat intelligence is AlienVault USM and the Open Threat Exchange®, OTX™. USM Anywhere is used by more than 7,000 commercial customers with a simple and affordable solution that centralizes threat detection, incident response, and compliance management for all environments.

Security Orchestration & Automation

Easily extend threat detection and incident response to third-party products like Office 365, Cisco Umbrella, and Palo Alto Networks. Continue to build on your current security software.

Q: How does CU Assured access my credit union's IT environment?

A: We will consult with you to review your size, number of IT assets, and IT environment to recommend one of our two monitoring forms with CU Assured: Federated or Multitenant.

Federated - A CU Assured All-in-One (AIO) is installed at the credit union's main office. The AIO collects logs and events from servers, PCs, switches, routers, firewalls, applications, and correlates the data looking for Indicators of Compromise (IoC). The credit union accesses the CU Assured dashboard to monitor and address threats. The AIO also sends alerts to the CU Assured Team who monitors and analyzes events. When required, the CU Assured Team notifies the credit union concerning IoC and is available to help.

Multitenant - Sensors are installed at the credit union's locations. These sensors collect logs and events from servers, PCs, switches, routers, firewalls, applications, and forwards all events to a CU Assured All-in-One (AIO) located at a PCI compliant Operation Center for correlation and analysis by the CU Assured Team. When required, the CU Assured Team notifies the credit union concerning IoC and is available to help. The credit union accesses the CU Assured dashboard to monitor and address threats.

Q: What is the definition of an asset on the credit union's IT environment?

A: An asset is one IP address under your environment. All assets are monitored by CU Assured.

Q: Do I have to give you a list of all my IT assets before launch?

A: We will scan your environment to determine the assets in your environment.

Q: How does CU Assured work with my current security software?

A: Logs are forwarded to the CU Assured AIO or Sensor. A current list of products with prebuilt plugins can be found here:

https://www.alienvault.com/documentation/usm-appliance/supported-plugins/supported-plugins.htm

Q: Can I demo CU Assured for testing or demo?

A: Yes. Please contact your Business Development Consultant or CUACG Auditor.
